About me

I am a creative and technical Game Programmer and 3D Artist based in Lagos, Nigeria. With 8+ years of experience as a digital artist and 4+ years specializing in game development and systems programming, I build interactive mobile and desktop titles using Unity (C#) and Blender. Skilled at converting high-level game briefs into modular gameplay mechanics, physics systems, and 3D visualizations.

I am passionate about building games and when I'm not building games, I spend a lot of time playing and learning from them. I dive into almost every genre; from fast-paced shooters and cozy simulators to massive open-world RPGs and action-adventures like Elden Ring, Grand Theft Auto, and Assassin's Creed. Always dissecting their core mechanics and systems to see how they are programmed.

Education & Training

Bachelor of Science(B.Sc) | Imo State University | 17/09/2018 - 14/09/2022 | Imo, Nigeria

-Computer Science

Level in EQF: 6

West African Senior School Certificate(WAEC) | High Achievers College | 19/09/2011 - 14/07/2017 | Lagos, Nigeria

Level in EQF: 3

Senior School Certificate(NECO) | High Achievers College | 19/09/2011 - 14/07/2017 | Lagos, Nigeria

Level in EQF: 3

Work experience

Game Programmer | Deluxe Creations Studio | 28/12/2021 - Current | Lagos, Nigeria

- Joined during 6-month industrial training internship and advanced rapidly to full-time Game Programmer.
- I am responsible for engineering core gameplay loops, physics interactions, and modular systems in Unity (C#).
- Bring ideas to life through playable prototypes.
- Shipped multiple published titles on Google Play Store & Steam: Rasta Santa, Grow Farm Garden, Captain EcoGen, Finger Gunner, Dribble Run.

3d Visualisation Artist | GDM Group | 02/10/2024 - 23/12/2024 | Lagos, Nigeria

- My job included conducting site surveys (recceing) of event venues and recreating locations & decorations in 3D environments; as well as designed 3D brand activation spaces, shopping stands, and marketing exhibition booths for client pre-visualizations.

Game Design Facilitator | Gidi Creative Centre | 24/10/2022 - 02/11/2022 | Lagos, Nigeria

- This was a digital skill training programme organised by the Lagos State government. I was designated 8 days where I was tasked with training students and career professionals on the principle of game design, core gaming mechanics, Blender 3D modeling, and level design.

Skills

C# for Unity (Unity3d) | Unity Engine | Visual Scripting (Unity Playmaker) | Blender 3d | Game AI Behavior | Systems Programming | Game Prototyping | Prototyping | Debugging & Optimisation | Prompt Engineering | Marvelous Designer(Clo3D) | Adobe Photoshop | Animation | digital game creation systems

Hobbies and Interests

Gaming, Anime, Music, Movies

Rasta Santa

Rasta Santa is a story-driven 2D action platformer and shooter developed at Deluxe Creation Studios.

- Translated the game's high-level concept brief into a fully working prototype using primitive placeholder assets to lay down the core platforming, shooting, and collision systems.
- Designed and built a highly modular framework so game systems, such as player ability, weapons, enemy paths, and UI elements, could be added or removed without breaking the core engine.
- Collaborated closely with the art team to cleanly swap primitive blocks and placeholder shapes with final 2D pixel-art assets once mechanics were fully tuned.
- Iterated on gameplay balancing based on playtester feedback, adding tactical layers like purchasable health packs and ad-based rewards on mobile.
- Set up unique levels, such as a chase (racing) level and a tower defense level, to add some variety to the gameplay loop.

Captain Eco Gen

Captain EcoGen is an educational environmental game developed at Deluxe Creation Studios.

- Programmed the core third-person top-down player controller and trash collection mechanics for the Street Cleanup mode, where players navigate Lagos streets gathering waste.
- Implemented the recycling-to-power-cell pipeline: collected trash is processed at the recycling factory into power cells, which players deliver to off-grid villages to restore their electricity.
- Built a fun fact popup system that triggers educational facts about recycling, solar energy, and pollution whenever players perform key actions like collecting trash, recycling, or producing power. Collected facts are stored in an in-game archive for revisiting.
- Integrated real-world Eco Missions using the AI image recognition system (from the Unity Image Recognition project), allowing players to photograph real-world waste for daily refreshed tasks that reward in-game currency.
- Built a dialogue and multi-choice option system for NPC interaction and quest selection.

Unity Image Recognition

This is a personal project that demonstrates real-time image classification and AI inference; built natively inside Unity 6 using the Unity Sentis framework.

- Researched, developed, and open-sourced the entire repository end-to-end as a solo project.
- Wrote core preprocessing scripts to reshape input textures into standard ONNX-compliant tensors, converting Texture2D formats to the required 1×3×224×224 shape.
- Set up the full inference pipeline using GPU Compute acceleration through Unity Sentis for real-time classification.
- Implemented features for sorting top class predictions and querying target confidence parameters.
- Originally born out of research for a Pokémon GO-style recyclables-tracking feature planned for Captain EcoGen, then packaged the result as a reusable template for other Unity developers.
